

- 1- The following table lists measurements of volumetric water content with absolute values of the corresponding soil water pressure head for a soil sample with a bimodal pore size distribution.

|   |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |
|---|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| Matric head (cm)                                  | 1     | 10    | 20    | 50    | 100   | 150   | 200   | 250   | 300   | 400   | 500   | 700   | 1000  | 2000  | 4000  | 6000  |
| Water content (cm <sup>3</sup> cm <sup>-3</sup> ) | 0.440 | 0.410 | 0.401 | 0.397 | 0.395 | 0.393 | 0.390 | 0.386 | 0.382 | 0.370 | 0.356 | 0.323 | 0.271 | 0.155 | 0.073 | 0.046 |

- a- Use the RETC model to fit  $\alpha$ ,  $n$  and  $\theta_r$  of the van Genuchten soil water retention model.  
 b- Use the RETC model to fit  $\alpha$ ,  $n$  and  $\theta_r$  of the Brooks and Corey soil water retention model.  
 c- Use the MS Excel to fit  $\alpha_1$ ,  $\alpha_2$ ,  $n_1$ ,  $n_2$ ,  $w_1$  and  $\theta_r$  of the following bimodal soil water retention model:

$$\frac{\theta - \theta_r}{\theta_s - \theta_r} = S_e = w_1 (1 + (\alpha_1 |h_m|)^{n_1})^{-m_1} + w_2 (1 + (\alpha_2 |h_m|)^{n_2})^{-m_2}$$

Note that  $w_1 + w_2 = 1$ ,  $0 \leq w_1 \leq 1$ ,  $0 \leq w_2 \leq 1$ ,  $m_i = 1 - (1/n_i)$ . Also, assume that  $\theta_s$  is known and equal to the water content value in the above table for  $h=1$  cm.

- 2- List the fixed and optimized parameter values, and plot the measured and fitted data (use a log-scale for the h-axis). Discuss results.  
 3- Repeat (1-c) and (2), but instead of the van Genuchten model, use a bimodal lognormal soil water retention model.
